-I-FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
NS3-NS4A, NS4A-FORMS A SAID NS5A-NSB.
-I-FUNCTION: NS4A-FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
ACTIVATION OF NS3.
-I-FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-I-FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
ESSENTIAL ROLE IN THE VIROS REPLICATION.
-I-CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
-I-CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide: the crystal structure provides insights into the mode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kim J.L., Morgenstern K.A., Griffith J.P., Dwyer M.D., Thomson J.A.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- SUBDIAT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
-!- PTM: THE STRUCTURAL PROTEINS C. E1 AND E2 ARE PRODUCED BY PROTECLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
-!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
-!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "Genomic structure of the human prototype strain H of hepatitis C virus: comparison with American and Japanese isolates.";

Mucheotide sequence of the genomic RNA of hepatitis C virus isolated
from a human carrier: comparison with reported isolates for conserved
and divergent regions. "I some thin the reported isolates for conserved
T. J. Gen. Virol. 72:8697-2704(1991).
J. Gen. Virol. 72:8697-2704(1991).
I. FUNCTION: THE SMALL PROFEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
OF CHARITIC ACTIVITY: Hydrolysis of four peptide bonds in the viral presented of the procursor polyprotein, commonly with Asp or Glu in the P6
postition, Cys or Thr in Pl and Ser or Ala in Pl'.
C. II. CATALTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (G922) (GP35); Envelope glycoprotein El (GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Proteasses/helicase NS3 (P70) (Hepperivitin)
(EC 3.4.21.98); Nonstructural protein NS5A (P65); Nonstructural protein NS5B (P66) (P70) (RNA directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-16) (HCV).
Viruses; SRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (RNA)(N).

SUBURIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPREIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          InterPro; IPR007095; RNA_pol_DS_PS.

The Taiwanese hepatitis C virus genome: sequence determination and mapping the 5' termini of viral genomic and antigenomic RNA.";
Virology 188:102-113(1992).
I- FUNCTION: THE SMALL PROTEINS NS2B, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (RNA)(N).
SUBUNTT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
         RNA-DIRECTED RNA POLYMERASE (POTENTIAL)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or A1a in P1. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 127; DB 1; Length 3033;

-1-SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

PROPEPTIDE CLEAVAGE IS A PREREQUISITE FOR EXIT OF FURIN MOLECULES OUT OF THE BNDOPLASMIC RETICCLUM (ER).

SECOND CLEAVAGE IN THE PROPEPTIDE OCCUR IN THE TRANS GOLGI NETWORK (TGN), WHICH IS FOLLOWED BY THE RELEASE OF THE PROPEPTIDE BOUND TO FURIN AND THE ACTIVATION OF FURIN.

TISSUE SPECIFICITY: SEEMS TO BE EXPRESSED UBIQUITOUSLY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 175,

Sequence 30, Application US/08921887
Patent No. 603071
GENERAL INFORMATION:
APPLICANT: KHUDYAKOV, YURI E.
APPLICANT: FIELDS, HOWARD A.
TITLE OF INVENTION: MOSAIC PROTEIN AND RESTRICTION
TITLE OF INVENTION: ENDONGLEASE ASSISTED LIGATION METHOD FOR MAKING THE SAME NUMBER OF SEQUENCES: 55
CORRESPONDENCE ADDRESS:
ADDRESSEE: JONES & ASKEW, LLP
                                                                                                                                                                                         Sequence Sequence
                                                                                                                                                                                                                                                                                 Sequence Sequence 1
                                                                                                                                                                                                                                                                                                                                                                         Sequence Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence S
                                                                                            Sequence
                                                                                                                                                  Sequence

Patent No. 5882852

GENERAL INFORMATION

APPLICANT: BUKH, J., MILLER, R.H. AND

TITLE OF INVENTION: NOCLEOTIDE AND DEDUCED

TITLE OF INVENTION: CORE GENES OF INVENTION: OPE

TITLE OF INVENTION: AMINO ACID SEQUENCES OF THE TITLE OF INVENTION: AMINO ACID SEQUENCES OF TITLE OF INVENTION: AMINO ACID SEQUENCES OF TITLE OF INVENTION: AMINO ACID SEQUENCES IN DIAGNOSTIC MENUMBER OF SEQUENCES: 263
CLASSIFICATION: 435
ATTORNEY/AGENT INFORMATION:
NAME: RICHARD W. BORK
REGISTRATION NUMBER: 36,459
REFERENCE/DOCKET NUMBER: 2026-4116
TELECOMMUNICATION INFORMATION:
TELEFAX: (212) 751-6849
TELEFAX: (212) 751-6849
TELEX: 421792
INFORMATION FOR SEQ ID NO: 188:
SEQUENCE CHARACTERISTICS:
LENGTH: 191 antho acids
TYPE: amino acid
TYPE: amino acid
STRANDENESS: unknown

Sequence 192, Application US/08635886C

Sequence 192, Application US/08635886C

Patent No. 6555114

GENERAL INFORMATION:

APPLICANT: LEROUX-NOELS, Geert

APPLICANT: DELEYS, Robert

TITLE OF INVENTION: IMMUNDOMINANT HUMAN T CELL EPITOPES OF HEPATITIS C

TITLE OF INVENTION: VIRUS

TITLE OF INVENTION: VIRUS

FILE REFERENCE: 2752-18

CURRENT APPLICATION NUMBER: US/08/635,886C

CURRENT APPLICATION NUMBER: PT/FE94/03555

PRIOR FILING DATE: 1994-10-28

PRIOR FILING DATE: 1994-10-28

SOFTWARE: PAPLICATION NUMBER: EP 93402718.6

NUMBER OF SEQ ID NOS: 286

SOFTWARE: Patentin version 3.1

SEQ ID NO 192

TYPE: PRIOR FILING DATE: PRIOR FILING DA

TITLE OF INVENTION: New sequences of hepatitis C virus
TITLE OF INVENTION: genotypes for diagnosis, prophylaxis and therapy.
NUMBER OF SEQUENCES: 270
COMPUTER READABLE FORM:
MEDIUM TYPE: FLOPPY disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New sequences of hepatitis C virus
genotypes for diagnosis, prophylaxis and therapy.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Virology 188:331-341(1992).
-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
PROTEIN MAND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R EMBL; D10074; BAA00968.1; ...

Genomic characterization and mutation rate of hepatitis C virus
'Genomic characterization and mutation rate of hepatitis C virus
1solated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2799(1992).
I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GINCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                  01-JUL-1993 (Rel. 26, Last sequence update)
16-OCT-2001 (Rel. 40, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP6B) (GP70) (NS1); (Frament).
Hepatitis C virus (isolate HCV-476) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein.

REMOVED FROM CAPSID PROTEIN C BY THE CELLULAR AMINOPEPTIDASE.

1 115 CAPSID PROTEIN C (POTENTIAL).
6 191 MATRIX PROTEIN (POTENTIAL).
2 383 MAJOR ENVELOPE PROTEIN E (POTENTIAL).
4 >520 NONSTRUCTURAL PROTEIN NSI/E2 (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-93019030; PubMed-1383400;
Abe K., Inchauspe G., Fujisawa K.;
Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1992).
I- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIXCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

01-AUG-1992 (Rel. 23, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
GROWE polyprotein E1 (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21)
(EC 3-4-22.-); Proteass/helicase NS3 (P70) (Hepacivirin)
(EC 3-4-21.98); Nonstructural protein NSA (P4); Nonstructural protein
NS48 (P27); Nonstructural protein NSA (P56); Nonstructural protein
NS58 (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Japanese) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DISCUSSION OF SEQUENCE.

15.52P-203 (Rel. 42, Last annotation update)
Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.99.-); Protease/helicase NS3 (P70) (Hepacivirin)
NS4 (P70); Nonstructural protein NS4A (P4); Nonstructural protein
NS5B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate H) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             X-RAY CRYSTALLOGRAPHY (2.1 ANGSTROMS) OF 1207-1657.

--- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MENA.
--- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "Genomic structure of the human prototype strain H of hepatitis C virus: comparison with American and Japanese isolates.";
